

Title: Nmap Localhost Scan

Command used:

```
nmap localhost  
nmap -sV localhost
```

Results:

- * Port 5000 (upnp) is open
- * Port 7000 (afs3-fileserver) is open
- * Port 8021 (ftp-proxy) is open

Analysis:

The scan shows that multiple ports are open on localhost. These ports are used by services running on the system. Open ports can be potential entry points if not properly secured.

Conclusion:

Basic network scanning was successfully performed using Nmap. The results help identify active services and possible security risks.
